

Top 10 Benefits of Hammerspace Tier 0

- 1. Activate the NVMe in the GPU servers that you already own** by turning this capacity into high-performance shared storage that is protected and usable by all GPU nodes.
- 2. Simple to deploy in hours, no new storage required:** No proprietary client or agent software to install, use the existing storage and networking infrastructure you already have
- 3. Avoid months of GPU depreciation expense** by putting your GPUs to work in hours.
- 4. Maximize GPU utilization, on-prem and in-cloud:** Feed data to GPUs at local NVMe speed, avoiding network bottlenecks and using fast inter-node networks on-prem and in-cloud
- 5. Accelerate AI training, tuning, and inferencing workloads** by delivering data up to 10x faster to GPUs.
- 6. Reduce storage and networking costs** by offsetting and reducing the need for external storage.
- 7. Reduce power consumption and rack space** by reducing the associated power and rack space those storage systems and switches would otherwise consume.
- 8. Enable hybrid-cloud agility** using automated data orchestration within a global namespace that spans data centers and cloud regions, including the use of Tier 0 in all four major cloud platforms
- 9. Eliminate manual data management and reduce operational complexity** by automating data protection across the GPU cluster
- 10. Extend from Tier 0 to Tier 1, Tier 2, and cloud storage** in a single global namespace for a simple, composable, and open architecture

Experience the Tier 0 Difference

Turn on the AI-Ready Infrastructure You Already Own.
